

VELoop Rewards

Technical SEO Recommendations

project	VELoop Rewards — Organic Search Growth Project
audience	Developer / technical implementation team
source	Findings carried forward from File 1 (SEO Audit) and File 6 (On-Page Recs)
prepared	12 September 2026

1. Summary for the Dev Team

Three issues below are marked **Critical** because they gate everything else in this project: if the homepage isn't reliably crawlable and indexable, none of the content, keyword, or link-building work in Files 2–7 can have any effect. These three should be verified and, if confirmed, fixed before any other item on this list.

- **JS-rendered content with no confirmed static fallback** — a plain fetch of the homepage returned only `<head>` metadata, no body content (File 1, Section 4).
- **robots.txt and sitemap.xml unconfirmed** — neither could be verified from outside the codebase in this audit pass.
- **Zero confirmed indexation** — a site: search returned no results at all (File 1, Section 3), which may simply mean the site is new, but must be confirmed via Search Console rather than assumed.

2. Critical Priority

Issue	Why It Matters	Recommended Solution	Priority	Owner
Homepage content may be entirely client-side rendered	If Googlebot's rendering pass fails or times out, the homepage could be indexed with an effectively empty body — no title relevance, no headings, nothing to rank on.	Run the URL through Google's Rich Results Test → “View Rendered HTML.” If body content is missing, implement server-side rendering (SSR) or static pre-rendering for the homepage and other priority pages.	Critical	Developer
robots.txt not confirmed	An unintentional Disallow rule would silently block Google from crawling part or all of the site with no visible symptom until traffic never arrives.	Check /robots.txt directly in a browser. Confirm it does not block important paths, and that it references the XML sitemap.	Critical	Developer
XML sitemap not confirmed	Without a sitemap, Google must discover every page purely through crawled links — slower discovery, and orphaned pages may never be found at all.	Generate/verify a sitemap.xml covering all public pages (homepage, feature pages, blog, trust pages). Reference it in robots.txt and submit it once Search Console access exists (Section 6).	Critical	Developer
No confirmed indexation in Google	A site: search and a brand-name search both returned zero results (File 1, Section 3) — this must be diagnosed, not assumed to be “just because it's new.”	Once Search Console access is granted (Section 6), check Coverage report for excluded/blocked pages, manual actions, or crawl errors. Request indexing for the homepage if it is confirmed clean.	Critical	Developer

3. High Priority

Issue	Why It Matters	Recommended Solution	Priority	Owner
Meta robots / indexability tags unverified	A leftover noindex tag from staging is a common, easy-to-miss cause of zero indexation — directly relevant given the File 1 finding.	Inspect the rendered DOM of the homepage and key pages for <meta name="robots"> tags. Remove any accidental noindex/nofollow before requesting indexing.	High	Developer
No confirmed public pages for core features	Refer & Earn, Games, Tasks, and Daily Rewards have no confirmed public landing pages (File 1, Section 6; File 6). These are the pages File 2's keyword map and File 5's content calendar depend on existing.	Build the public feature pages listed in File 6 (On-Page Recs) before or alongside publishing the matching blog articles from File 5, so internal links in File 7 have somewhere to point.	High	Developer / Content
No confirmed blog / CMS structure	Without a blog, the entire 12-article content calendar (File 5) has nowhere to be published, and the content cluster strategy (brief Section 15) can't function.	Confirm or build a /blog index with category support (Rewards Guides, Earning Guides, Referral Guides, Platform Guides — brief Section 14) before Month 1 publishing begins.	High	Developer
Canonical tags unverified	Feature-heavy platforms often generate near-duplicate authenticated/public variants of the same page; without canonicals, Google may pick the wrong version to index or split ranking signals.	Confirm rel="canonical" is present and correct on every public page, especially any page with query parameters or authenticated variants.	High	Developer
www vs. non-www redirect not confirmed	If both https://velooprewards.in and https://www.velooprewards.in resolve without a 301 redirect between them, Google may treat them as duplicate content and split authority.	Confirm a single canonical host (www, per the current homepage) with a 301 redirect from the other variant.	High	Developer

4. Medium & Low Priority

Issue	Why It Matters	Recommended Solution	Priority	Owner
Core Web Vitals / page speed not measured	Page experience is a ranking factor and directly affects registration conversion rate, but requires a rendered-page tool, not a static fetch.	Run PageSpeed Insights on the homepage and top 3 feature pages once built; address any “poor” Core Web Vitals scores.	Medium	Developer
Image optimisation unverified	Unoptimised images slow page load and miss an easy accessibility/SEO win (alt text) at essentially no cost.	Once pages are crawlable, audit file names, alt text, compression, and modern formats (WebP/AVIF) per brief Section 20.	Medium	Developer / Content
Full-site broken-link / redirect-chain check not run	Not assessable from a single homepage fetch; broken links quietly erode both user trust and crawl efficiency.	Run a Screaming Frog crawl (free tier, up to 500 URLs) once the sitemap/page list is confirmed; fix any 404s or redirect chains found.	Medium	SEO Intern
Mobile usability only partially confirmed	A responsive viewport meta tag is present (good baseline) but full mobile usability needs a real rendering pass.	Run a PageSpeed Insights mobile pass on key pages; confirm tap targets, font sizes, and layout stability.	Low	Developer
Duplicate/thin authenticated pages	Dashboard-only feature variants (Wallet, Exchange Center UI) could be accidentally crawlable and indexed as thin content if not explicitly handled.	Confirm noindex or authentication-gating on all dashboard/authenticated routes, per the recommendations in File 6's Feature Page Indexability tab.	Low	Developer

5. Search Console Data Requirements

Per brief Section 35, this project does not include Search Console access. The list below is what should be requested — with an appropriate, restricted user role rather than owner-level credentials — once VElLoop is ready to provide it for a second phase.

Data Needed	Why It's Needed
Top queries, impressions, clicks, CTR	Confirms which of the keywords in File 2 are actually driving impressions, and where title/meta description rewrites (File 6) could lift CTR.
Average position	Tracks whether the technical and content fixes in this report are actually moving rankings over the 90-day roadmap (File 11).
Indexed page count	Directly answers the File 1 “zero results” finding — confirms whether pages are indexed, excluded, or simply not yet crawled.
Coverage / indexing issues report	Surfaces the exact reason behind any indexing problem — crawl error, noindex tag, duplicate content, or something else — rather than guessing.
Sitemap status	Confirms whether a submitted sitemap was processed successfully and how many URLs from it were indexed.
Core Web Vitals report (Search Console)	Cross-checks the PageSpeed Insights findings above against real-user field data over time.

Google provides multiple permission levels for Search Console users (Owner, Full, Restricted) — a Restricted or Full user role is sufficient for everything above and does not require sharing owner-level account credentials.

6. Suggested Implementation Sequence

A practical build order for the developer, sequencing the tables above so nothing is built on top of an unconfirmed foundation.

Step	What	Depends On
1	Verify robots.txt, sitemap.xml, and rendered homepage content (Section 2)	Nothing — do this first
2	Confirm/fix meta robots tags and canonical tags site-wide (Section 3)	Step 1
3	Request Search Console access at a Restricted/Full role and confirm real indexation status (Section 5)	Steps 1–2
4	Build confirmed-missing public pages: feature pages, blog index, trust page, FAQ (Section 3; File 6)	Step 1
5	Publish Month 1 content from File 5 into the now-live blog	Step 4
6	Run PageSpeed Insights + Screaming Frog full crawl; fix Medium/Low items (Section 4)	Steps 1, 4
7	Re-check Search Console coverage and query data after 3–4 weeks	Step 3, 5
